

# Feedback - Group J - NYC Real State

TA: Nico Rojas

04/02/2021

## General Comments.

- The proposal is about a critical health condition and you have located some data sets.
- However, I am worried that you may be late in terms of defining the visualizations you need for the final project and start working on them.
- I encourage you to make a tentative list of specific visualizations besides the HIV atlas and the possible second map and start working on them. You need to make sure you have all the variables you will need. Remember to check the types of visualizations required in the syllabus. Notably, you need at least one interactive visualization. Below, I'm giving you some additional comments.

## Specific Comments.

- In the introduction you mentioned you have information from 2000 to 2020.
  - How do you plan to take advantage of the temporal variation of your data?
  - Are you planning to graph some time-series?
  - Have you considered using Shiny? Shiny offers you the possibility to map a ggplot graph that changes depending on the year you choose.
- Are you only interested in HIV prevalence? You can download data from HIV response from your sources.
- Have you already decided how are you going to narrow your second map to more specific areas? Will this be your interactive visualization? Why?
